TOPIC 03 | AI AGENT CORE COMPONENTS

Implementation evidence and multi-turn validation

Workflow: Topic_03_AI_Agent_Core_Components | Platform: n8n | Evidence: user-provided screenshots

Assessment scope

The workflow uses a Chat Trigger, AI Agent, Chat Model, Simple Memory, Calculator tool, and Structured Output Parser. Three sequential chat tests demonstrate context retention, arithmetic, and schema-conforming responses.

Test summary

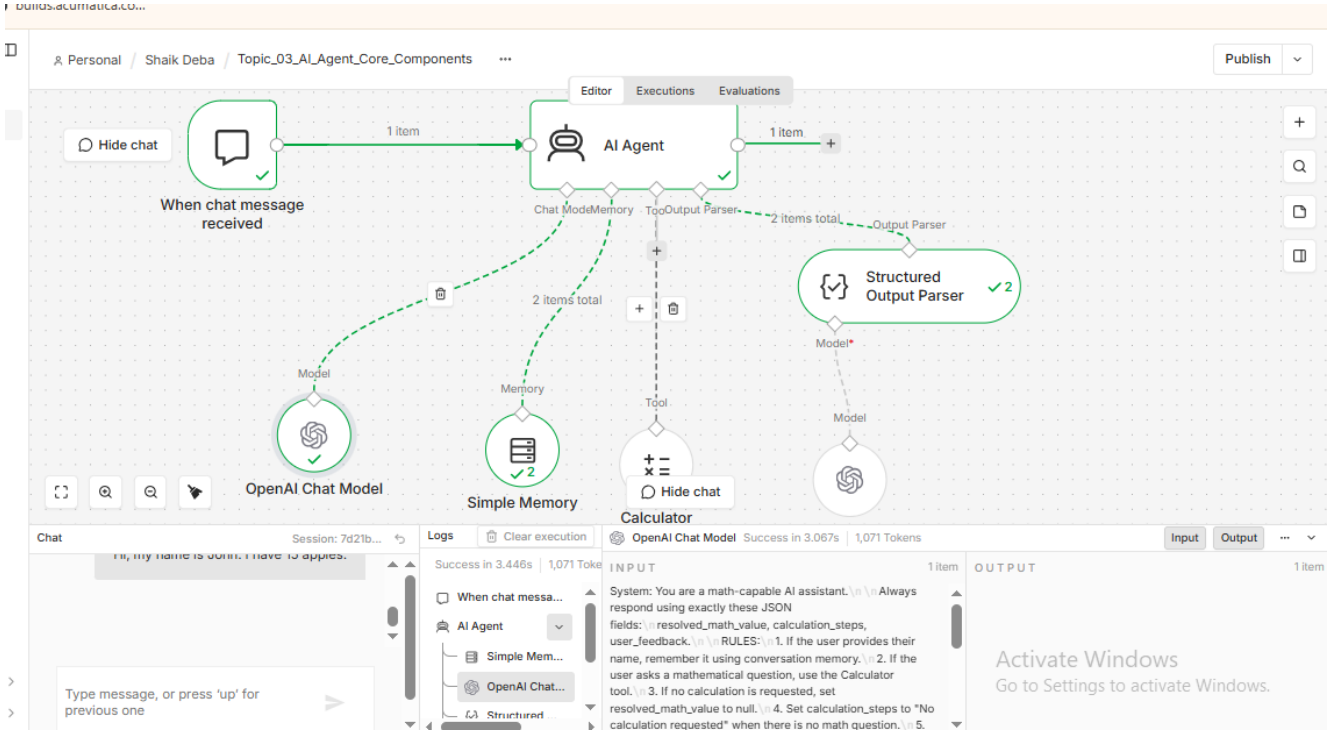

Test	Observed output	Result
T1 - Initial context	John; 15 apples; no calculation	PASS
T2 - Arithmetic	15 - 3 + 5 = 17; Calculator executed	PASS
T3 - Recall	John; 17 apples; no calculation	PASS

Evidence notes

Screenshots below are preserved from the chat session. Success is supported by the green execution indicators and the actual AI Agent outputs. The precise memory-window and max-iteration values are not visible in the final execution screenshots.

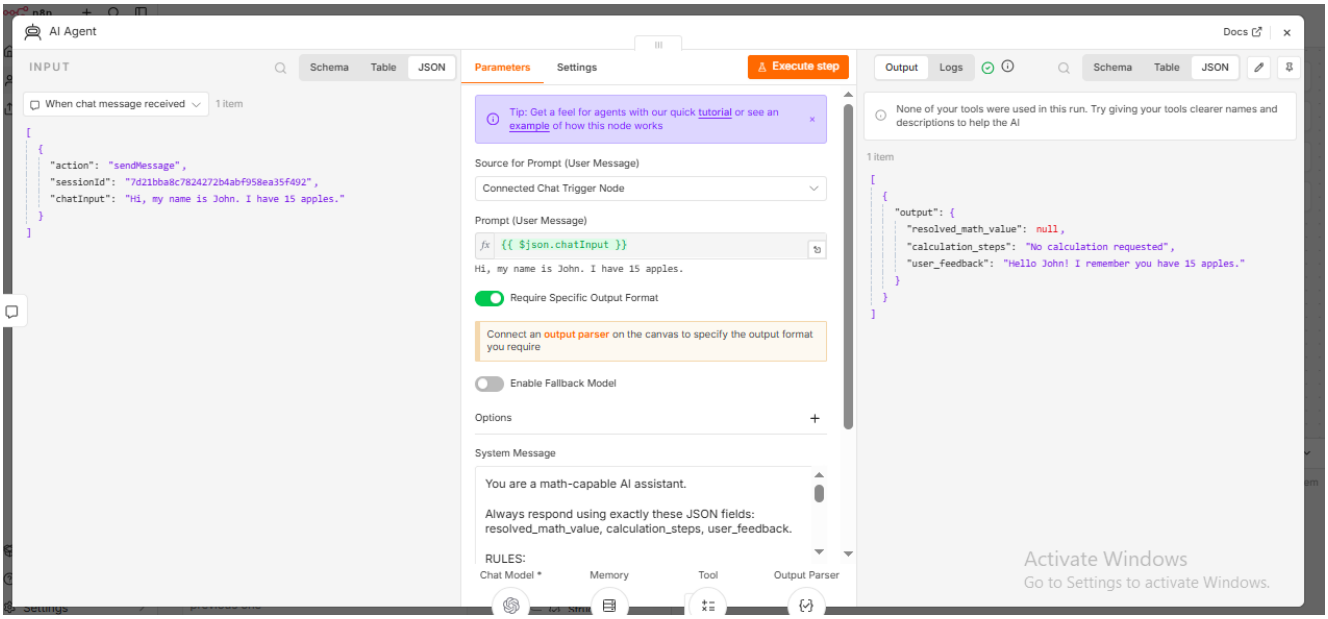

Evidence 01

Workflow and successful initial memory test.

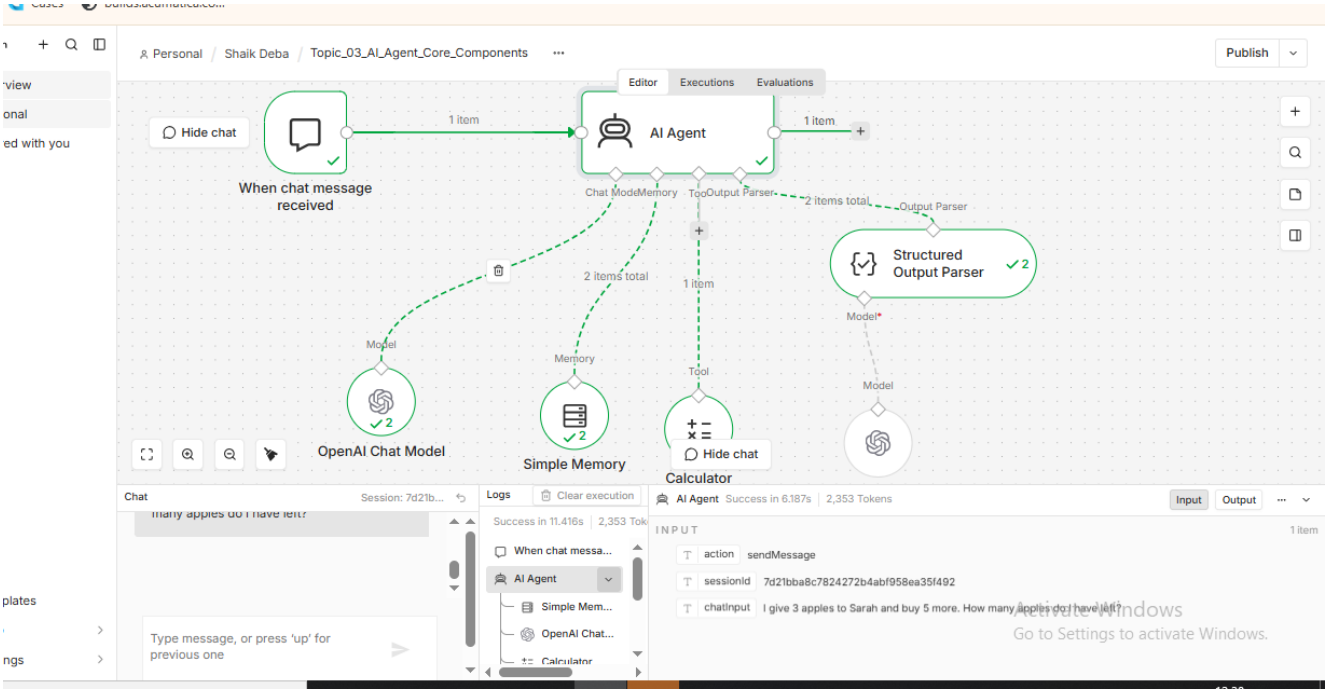

Evidence 02

AI Agent structured output: John and 15 apples.

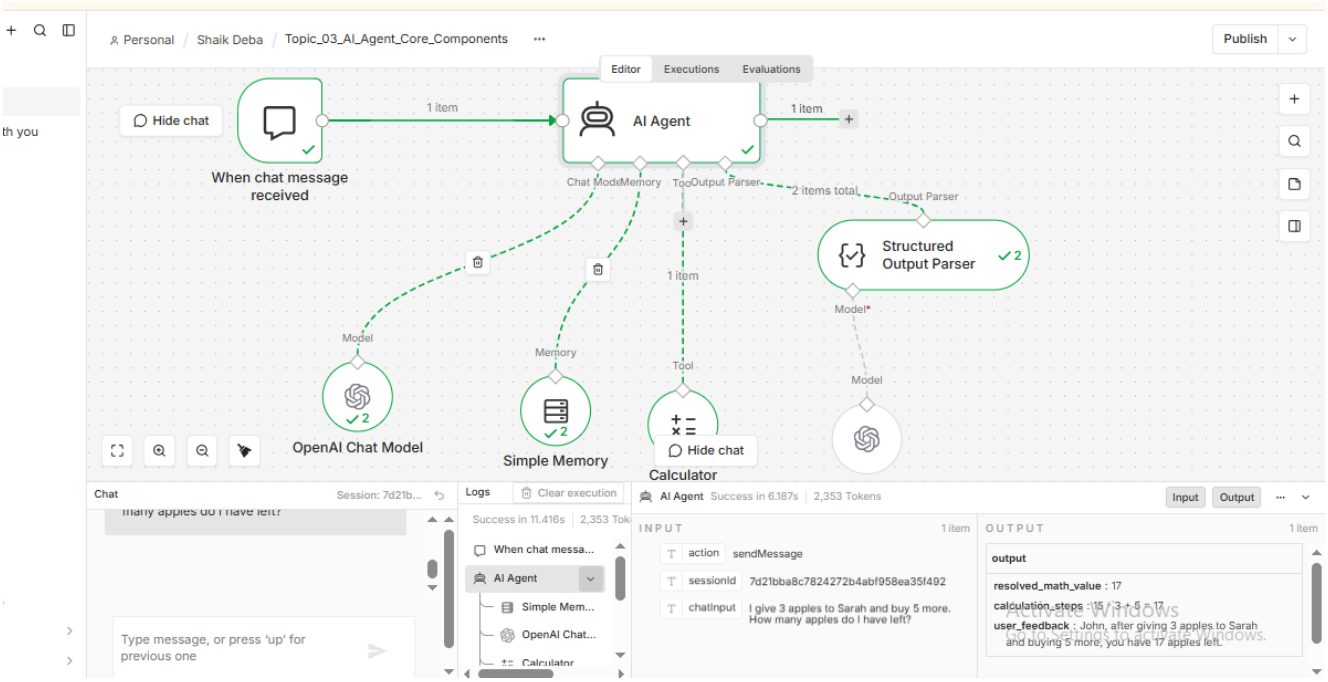

Evidence 03

Workflow execution showing the Calculator branch used.

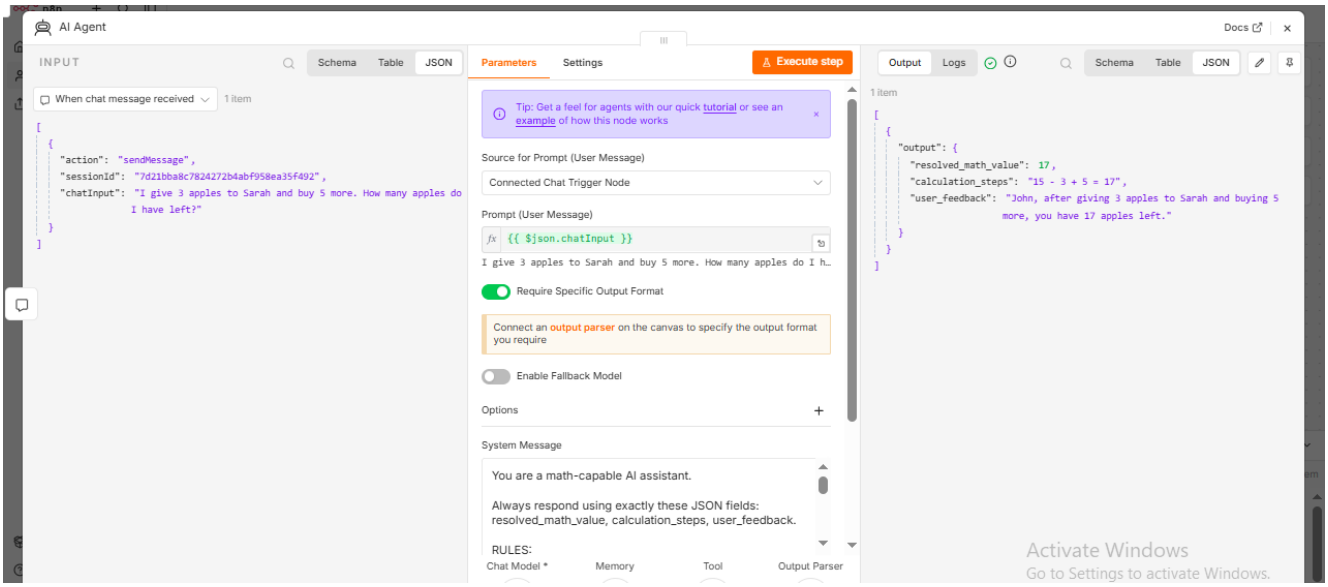

Evidence 04

Arithmetic test: structured output with result 17.

Evidence 05

AI Agent JSON response: 15 - 3 + 5 = 17.

Evidence 06

Final memory recall: John has 17 apples.
